PROJECT DEVELOPMENT PHASE

IMPLEMENTATION STEPS

1. **Access the ServiceNow Instance**

The first step in the implementation process is logging into the ServiceNow platform. The system administrator accesses the ServiceNow instance using valid login credentials. After successful login, the main dashboard appears where different modules and configuration tools are available.

From this environment, administrators can access components such as Incident forms, UI Policies, and Update Sets, which are required to implement mandatory field rules and manage configuration changes.

2. Create or Choose an Update Set

Before starting any configuration work, it is important to create an Update Set. Update Sets are used to record configuration changes so they can be transferred to another ServiceNow instance later.

Steps involved:

- Navigate to System Update Sets → Local Update Sets
- Click New
- Enter a suitable name for the Update Set
- Example: Mandatory Fields Configuration
- Click Submit

Set the created Update Set as the Current Update Set

By doing this, all configuration changes performed during development will be captured automatically.

3. Open the Incident Form

Next, the form where mandatory fields will be applied must be accessed.

Steps:

- Navigate to Incident → Create New
- Open the Incident Form

- Identify the fields that need to be made mandatory
- Examples of such fields include:
- Short Description
- Category
- Priority
- Assigned To

These fields will later be controlled through UI Policies.

4. Create a UI Policy

UI Policies are used to manage the behavior of form fields without writing scripts. They allow administrators to control whether fields are mandatory, visible, or read-only depending on specific conditions.

Steps:

- Navigate to System UI → UI Policies
- Click New
- Select the Incident Table
- Enter a name for the policy
- Define the condition if required

Example Condition:

If Category = Software, then the Assigned To field should become mandatory.

5. Set UI Policy Actions

After the UI Policy is created, UI Policy Actions must be defined. These actions determine how specific fields should behave when the policy condition is satisfied.

Steps:

- Open the newly created UI Policy
- Go to the UI Policy Actions section
- Click New
- Choose the required field (Example: Assigned To)
- Set Mandatory = True

This ensures that the selected field becomes mandatory when the defined condition is triggered.

6. Save and Test the Policy

After configuring the UI Policy and actions, the configuration should be saved and tested to ensure it works properly.

Testing Steps:

- Open the Incident Form
- Trigger the condition defined in the UI Policy
- Attempt to submit the form without entering the mandatory field

The system should display a validation message and prevent submission until the required field is filled.

7. Record Changes in the Update Set

All configuration changes created during the implementation process are automatically recorded in the active Update Set.

Steps:

- Navigate to System Update Sets → Local Update Sets
- Open the current Update Set
- Check the Customer Updates section

Here, the UI Policy and related configuration changes will be listed, confirming that they are ready for migration.

8. Transfer the Update Set to Another Instance

To move the configuration changes to another environment, the Update Set must be exported and imported.

Steps:

- Open the Update Set
- Select Export to XML
- Import the XML file into the target ServiceNow instance
- Navigate to Retrieved Update Sets
- Preview the Update Set
- Click Commit

This process applies the configuration changes in the new instance.

9. Validate the Implementation

After migration, verification is performed to ensure that the UI Policy is functioning correctly.

Verification Steps:

Open the Incident Form

- Trigger the condition defined in the UI Policy
- Check whether the required fields become mandatory
- Try submitting the form without entering the required data
- If the system prevents submission until mandatory fields are filled, the implementation is successful.

TOOLS USED

1. ServiceNow Platform

ServiceNow is a cloud-based service management platform that helps organizations automate workflows and manage IT services. It provides tools for configuration, form management, and workflow automation.

2. UI Policies

UI Policies are configuration rules in ServiceNow that control the behavior of form fields dynamically. They can make fields mandatory, read-only, or visible depending on certain conditions.

3. UI Policy Actions

UI Policy Actions specify what changes should occur to form fields when the conditions of a UI Policy are satisfied.

4. Update Sets

Update Sets are used to capture configuration changes made in a ServiceNow instance. They allow administrators to move those changes from one environment to another, such as from development to testing or production.

UI Policy - Fields se...
UI Policy
Fields set to mandatory for all states
Update
Delete
UI policies change fields on a form based on a set of conditions. Use UI policies to show or hide fields, or to make fields mandatory or read-only based on these conditions. A UI policy specifies one or more actions to take when the policy is triggered. First, create the policy. Then add as many actions as necessary. UI policy actions are applied only if all of the following conditions are met:
The UI Policy is Active
The items in the Conditions field evaluate to true
The field specified in the UI policy action is present on the specified form
